# CS217: Artificial Intelligence and Machine Learning (associated lab: CS240)

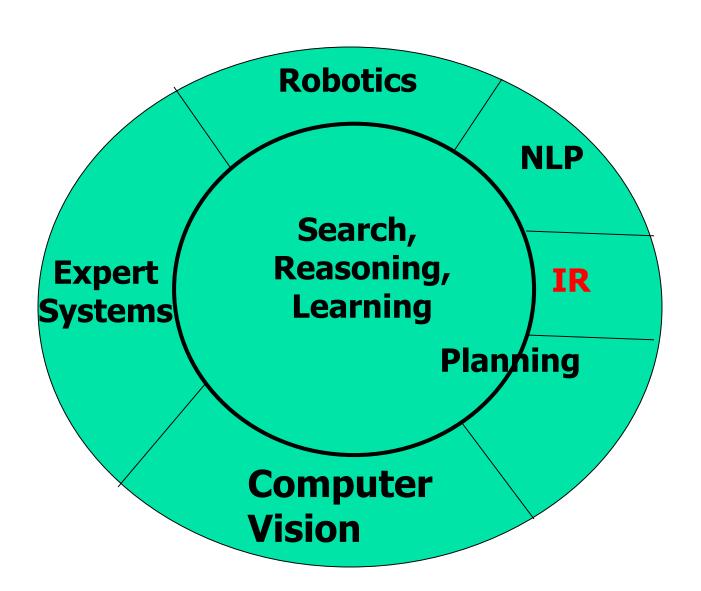

Pushpak Bhattacharyya
CSE Dept.,
IIT Bombay
Week2 of 13jan25, A\*

## Main points covered: week of 6jan25

#### Course website: very important

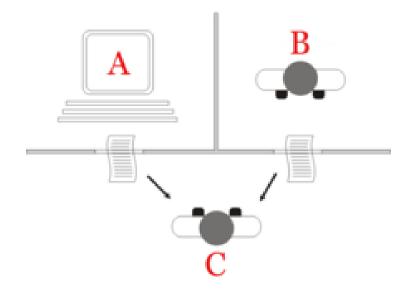

https://www.cse.iitb.ac.in/~cs217/2025/

#### **AI Perspective (post-web)**

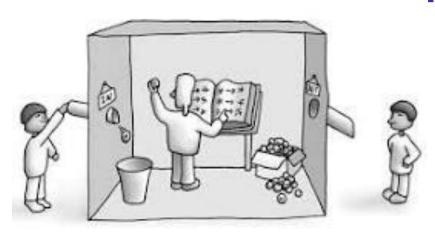

### Turing Test (wikipedia)

- The Turing test, originally called the imitation
   game by Alan Turing in 1950
- Test of a machine's ability to exhibit intelligent behavior
- Equivalent to, or indistinguishable from, that of a human

The "standard interpretation" of the Turing test, in which player C, the interrogator, is given the task of trying to determine which player – A or B – is a computer and which is a human. The interrogator is limited to using the responses to written questions to make the determination

### Searl's Chinese Room Experiment

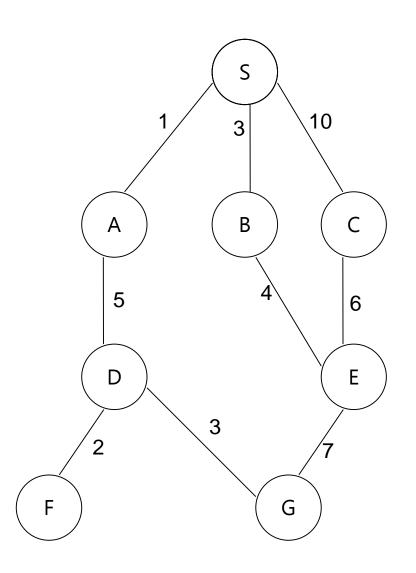

- A computer program cannot have a "mind", "understanding", or "consciousness", regardless of how intelligently or human-like the program may make the computer behave. Philosopher John Searle presented the argument in his paper "Minds, Brains, and Programs", published in *Behavioral and Brain Sciences* in 1980.
- A human being sits in the room and does exactly as the program does, gives an impression of "knowing"
   Chinese, but in actuality does not understand Chinese.

### Grading (Tentative)

- CS217
  - Midsem: 30%
  - Endsem: 50%
  - Quizzes (2): 20%
- CS240
  - Weekly lab: each 10%
  - Midsem exam: 10%
  - Final Viva: 20%

#### General Graph search Algorithm

Graph G = (V,E)

- 1) Open List : S (Ø, 0)
  Closed list : Ø
- 2) OL:  $A^{(S,1)}$ ,  $B^{(S,3)}$ ,  $C^{(S,10)}$ CL: S
- 3) OL:  $B^{(S,3)}$ ,  $C^{(S,10)}$ ,  $D^{(A,6)}$ CL: S, A
- 4) OL:  $C^{(S,10)}$ ,  $D^{(A,6)}$ ,  $E^{(B,7)}$ CL: S, A, B
- 5) OL:  $D^{(A,6)}$ ,  $E^{(B,7)}$ CL: S, A, B, C

- 6) OL:  $E^{(B,7)}$ ,  $F^{(D,8)}$ ,  $G^{(D,9)}$ CL: S, A, B, C, D
- 7) OL:  $F^{(D,8)}$ ,  $G^{(D,9)}$ CL: S, A, B, C, D, E
- 8) OL : G<sup>(D,9)</sup> CL : S, A, B, C, D, E, F
- 9) OL : Ø CL : S, A, B, C, D, E, F, G

## Steps of GGS (principles of AI, Nilsson,)

- 1. Create a search graph *G*, consisting solely of the start node *S*; put *S* on a list called *OPEN*.
- 2. Create a list called CLOSED that is initially empty.
- 3. Loop: if OPEN is empty, exit with failure.
- 4. Select the first node on OPEN, remove from OPEN and put on CLOSED, call this node n.
- 5. if n is the goal node, exit with the solution obtained by tracing a path along the pointers from n to s in G. (ointers are established in step 7).
- 6. Expand node *n*, generating the set *M* of its successors that are not ancestors of *n*. Install these memes of *M* as successors of *n* in *G*.

#### GGS steps (contd.)

- T. Establish a pointer to n from those members of M that were not already in G (i.e., not already on either OPEN or CLOSED). Add these members of M to OPEN. For each member of M that was already on OPEN or CLOSED, decide whether or not to redirect its pointer to n. For each member of M already on CLOSED, decide for each of its descendents in G whether or not to redirect its pointer.
- 8. Reorder the list OPEN using some strategy.
- 9. Go LOOP. Like heap or set or something that actually gives priority to some nodes based on some value.

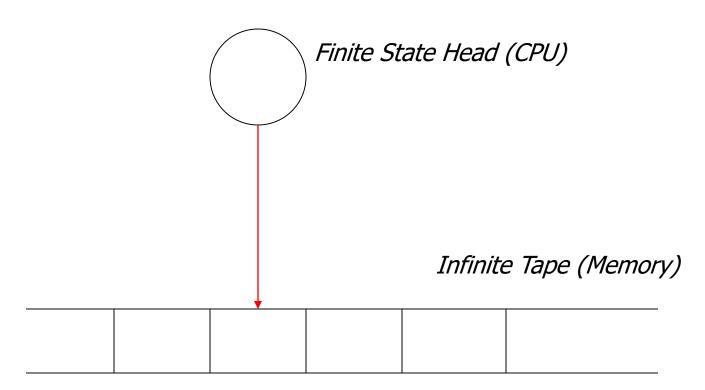

## End of main points

#### **Foundational Points**

#### **Foundational Points**

- Church Turing Hypothesis
  - Anything that is computable is computable by a Turing Machine
  - Conversely, the set of functions computed by a Turing Machine is the set of ALL and ONLY computable functions

## **Turing Machine**

- Physical Symbol System Hypothesis (Newel and Simon)
  - For Intelligence to emerge it is enough to manipulate symbols

- Society of Mind (Marvin Minsky)
  - Intelligence emerges from the interaction of very simple information processing units
  - Whole is larger than the sum of parts!

Intelligence is an emergent property.

- Limits to computability
  - Halting problem: It is impossible to construct a Universal Turing Machine that given any given pair <M, I> of Turing Machine M and input I, will decide if M halts on I
  - What this has to do with intelligent computation? *Think!*

Don't wait for output to show up if it doesn't show up in soon time.

- Limits to Automation
  - Godel Theorem: A "sufficiently powerful" formal system cannot be BOTH complete and consistent
  - "Sufficiently powerful": at least as powerful as to be able to capture Peano's Arithmetic
  - Sets limits to automation of reasoning

- Limits in terms of time and Space
  - NP-complete and NP-hard problems: Time for computation becomes extremely large as the length of input increases
  - PSPACE complete: Space requirement becomes extremely large
  - Sets limits in terms of resources

## Two broad divisions of Theoretical CS

- Theory A
  - Algorithms and Complexity
- Theory B
  - Formal Systems and Logic

### AI as the forcing function

- Time sharing system in OS
  - Machine giving the illusion of attending simultaneously with several people
- Compilers
  - Raising the level of the machine for better man machine interface
  - Arose from Natural Language Processing (NLP)
    - NLP in turn called the forcing function for AI

### Allied Disciplines

Philosophy	Knowledge Rep., Logic, Foundation of AI (is AI possible?)
Maths	Search, Analysis of search algos, logic
Economics	Expert Systems, Decision Theory, Principles of Rational Behavior
Psychology	Behavioristic insights into AI programs
Brain Science	Learning, Neural Nets
Physics	Learning, Information Theory & AI, Entropy, Robotics
Computer Sc. & Engg.	Systems for AI

#### Symbolic AI

**Connectionist AI is contrasted with Symbolic AI** 

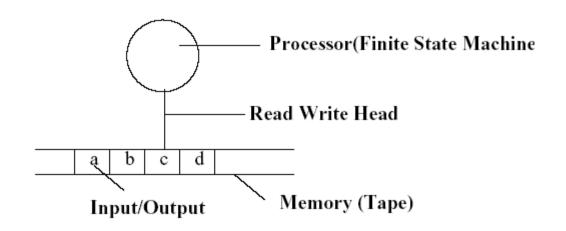

Symbolic AI - Physical Symbol System Hypothesis

Every intelligent system can be constructed by storing and processing symbols and nothing more is necessary.

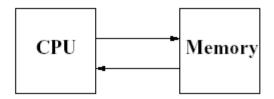

Symbolic AI has a bearing on models of computation such as

**Turing Machine Von Neumann Machine Lambda calculus** 

#### **Turing Machine & Von Neumann Machine**

Turing machine

VonNeumann Machine

#### **Challenges to Symbolic AI**

Motivation for challenging Symbolic AI
A large number of computations and information process tasks that living beings are comfortable with, are not performed well by computers!

#### The Differences

Brain computation in living beings	TM computation in	
computers		
Pattern Recognition	<b>Numerical Processing</b>	
Learning oriented	Programming oriented	
Distributed & parallel processing processing	Centralized & serial	
Content addressable	Location addressable	

## A\* Search: one of the pillars of AI

#### Search building blocks

- State Space : Graph of states (Express constraints and parameters of the problem)
- > Operators : Transformations applied to the states.
- > Start state :  $S_0$  (Search starts from here)
- $\rightarrow$  Goal state :  $\{G\}$  Search terminates here.
- > Cost : Effort involved in using an operator.
- > Optimal path : Least cost path

#### Examples

Problem 1:8 – puzzle

4	3	6
2	1	8
7		5

1	2	3
4	5	6
7	8	

S

G

Tile movement represented as the movement of the blank space. Operators:

L: Blank moves left

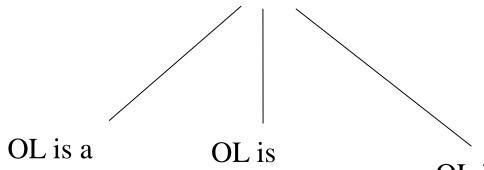

R: Blank moves right

U: Blank moves up

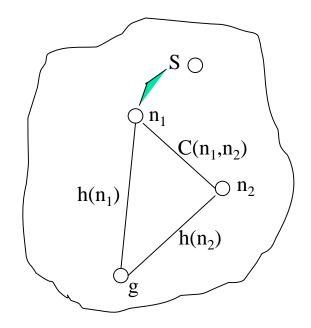

D: Blank moves down

$$C(L) = C(R) = C(U) = C(D) = 1$$

#### GGS is a general umbrella

queue stack (BFS) (DFS)

OL is accessed by using a functions f=g+h

J = g + n (Algorithm A)

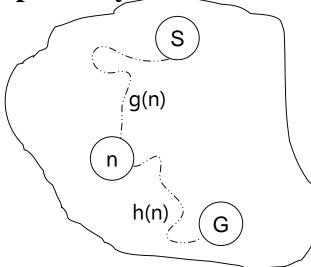

#### Algorithm A

- A function f is maintained with each node f(n) = g(n) + h(n), n is the node in the open list
- Node chosen for expansion is the one with least f value
- For BFS: h = 0, g = number of edges in the path to S
- For DFS: h = 0,  $g = \frac{1}{\text{No of edges in the path to S}}$

### Algorithm A\*

- One of the most important advances in AI
- g(n) = least cost path to n from S found so far
- $h(n) \le h^*(n)$  where  $h^*(n)$  is the actual cost of optimal path to G(node to be found) from n

"Optimism leads to optimality"

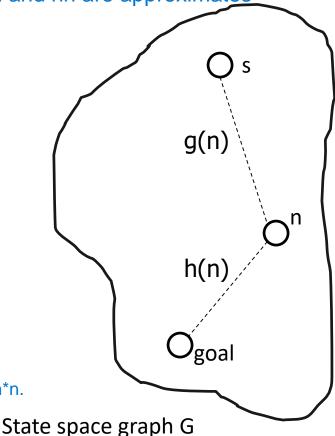

## A\* Algorithm – Definition and Properties

The star things are actual costs whereas the simple fn, gn and hn are approximates

- f(n) = g(n) + h(n)
- The node with the least value of f is chosen from the OL.
- $f^*(n) = g^*(n) + h^*(n)$ , where,  $g^*(n) =$ actual cost of the optimal path (s, n) $h^*(n) =$ actual cost of optimal path (n, g)
- $g(n) \ge g^*(n)$

The heuristic hn must be admissible, meaning it never overestimates h\*n.

■ By definition,  $h(n) \le h^*(n)$ 

#### 8-puzzle: heuristics

Example: 8 puzzle

S

2	1	4
7	8	ന
5	6	

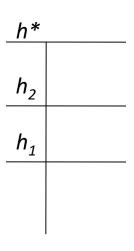

1	6	7
4	3	2
5		8
	n	

1	2	3
4	5	6
7	8	
	g	

 $h^*(n)$  = actual no. of moves to transform n to g

- 1.  $h_1(n)$  = no. of tiles displaced from their destined position.
- 2.  $h_2(n)$  = sum of Manhattan distances of tiles from their destined position.

$$h_1(n) \le h^*(n)$$
 and  $h_1(n) \le h^*(n)$ 

Comparison

#### A\* critical points

#### Goal

- Do we know the goal?
- Is the distance to the goal known?
- 3. Is there a path (known?) to the goal?

#### A\* critical points

#### About the path

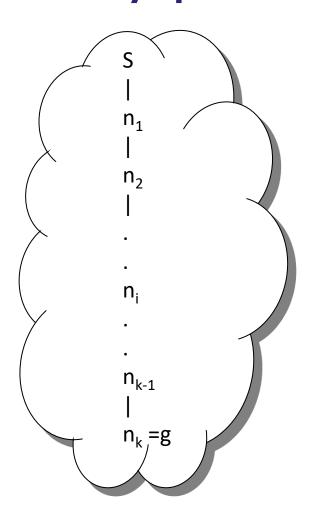

Any time before A\* terminates there exists on the OL, a node from the optimal path all whose ancestors in the optimal path are in the CL.

This means,

**3** in the OL always a node 'n' s.t.

$$g(n) = g^*(n)$$

# Key point about A\* search

### **Statement:**

Let  $S - n_1 - n_2 - n_3 \dots n_i \dots - n_{k-1} - n_k (=G)$  be an optimal path.

At any time during the search:

- There is a node n<sub>i</sub> from the optimal path in the OL
- 2. For  $n_i$  all its ancestors  $S_1, n_1, n_2, ..., n_{i-1}$  are in CL
- $g(n_i) = g^*(n_i)$

## Proof of the statement

```
Proof by induction on iteration no. j
```

```
Basis : j = 0, S is on the OL, S satisfies the statement
```

```
<u>Hypothesis</u>: Let the statement be true for j = p(p^{th} iteration)
```

Let n<sub>i</sub> be the node satisfying the statement

# Proof (continued)

Induction: Iteration no. j = p+1

Case 1: n<sub>i</sub> is expanded and moved to the closed list

Then,  $n_{i+1}$  from the optimal path comes to the OL

Node  $n_{i+1}$  satisfies the statement Why would be say such a thing? (note: if  $n_{i+1}$  is in CL, then  $n_{i+2}$  satisfies the property)

Case 2 : Node  $x \neq n_i$  is expanded Here,  $n_i$  satisfies the statement

# A\* Algorithm- Properties

- Admissibility: An algorithm is called admissible if it always terminates and terminates in optimal path
- **Theorem**: A\* is admissible.
- **Lemma**: Any time before  $A^*$  terminates there exists on OL a node n such that  $f(n) <= f^*(s)$
- **Observation**: For optimal path  $s \rightarrow n_1 \rightarrow n_2 \rightarrow ... \rightarrow g_t$ 
  - 1.  $h^*(g) = 0$ ,  $g^*(s)=0$  and
  - 2.  $f^*(s) = f^*(n_1) = f^*(n_2) = f^*(n_3)... = f^*(g)$

# A\* Properties (contd.)

$$f^*(n_i) = f^*(s),$$
  $n_i \neq s$  and  $n_i \neq g$ 

Following set of equations show the above equality:

$$f^*(n_i) = g^*(n_i) + h^*(n_i)$$

$$f^*(n_{i+1}) = g^*(n_{i+1}) + h^*(n_{i+1})$$

$$g^*(n_{i+1}) = g^*(n_i) + c(n_{i,1}, n_{i+1})$$

$$h^*(n_{i+1}) = h^*(n_i) - c(n_{i,1}, n_{i+1})$$

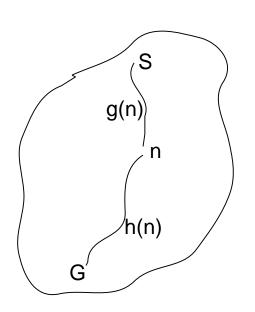

Above equations hold since the path is optimal.

increment in g to its successor is equal to the decrement in h to its successor.

# Admissibility of A\*

A\* always terminates finding an optimal path to the goal if such a path exists.

### **Intuition**

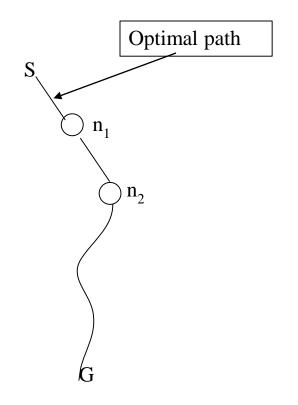

- (1) In the open list there always exists a node n such that  $f(n) \le f^*(S)$ .
- (2) If A\* does not terminate, the f value of the nodes expanded become unbounded. our implementation of DFS didn't terminate because of this because its f value kept decrementing.
- 1) and 2) are together inconsistent

Hence A\* must terminate

### <u>Lemma</u>

Any time before A\* terminates there exists in the open list a node n' such that  $f(n') <= f^*(S)$  What is the comment when it will terminate?

For any node  $n_i$  on optimal path,

$$f(n_i) = g(n_i) + h(n_i)$$
  
<=  $g*(n_i) + h*(n_i)$ 

Also 
$$f^*(n_i) = f^*(S)$$

Let n' be the first node in the optimal path that is in OL. Since <u>all</u> parents of n' in the optimal have gone to CL,

heuristic can't overestimate.

$$g(n') = g*(n')$$
 and  $h(n') <= h*(n')$   
=>  $f(n') <= f*(S)$ 

### If A\* does not terminate

Let *e* be the least cost of all arcs in the search graph. If A\* do not terminates then g(n) will keep increasing making the f() increasing -> unbounded.

Then g(n) >= e.l(n) where l(n) = # of arcs in the path from S to n found so far. If  $A^*$  does not terminate, g(n) and hence f(n) = g(n) + h(n) [h(n) >= 0] will become unbounded.

This is not consistent with the lemma. So A\* has to terminate.

## 2<sup>nd</sup> part of admissibility of A\*

The path formed by A\* is optimal when it has terminated

### **Proof**

Suppose the path formed is not optimal Let *G* be expanded in a non-optimal path.

At the point of expansion of G,

$$f(G) = g(G) + h(G)$$
  
=  $g(G) + 0$   
>  $g*(G) = g*(S) + h*(S)$   
=  $f*(S) [f*(S) = cost of optimal path]$ 

This is a contradiction because before termination node n in OL exists f(n) <= f\*(S) so A\* would pick that instead of G.

So path should be optimal

## Summary on Admissibility

- 1. A\* algorithm halts
- 2. A\* algorithm finds optimal path

if estimate of node is less than the true cost in optimal path then it will be explored by A\* algorithm

- 3. If f(n) < f\*(S) then node n has to be expanded before termination fn is estimate.</li>
- 4. If A\* does not expand a node n before termination then  $f(n) >= f^*(S)$

# Exercise-1

Prove that if the distance of every node from the goal node is "known", then no "search:" is necessary

#### Ans:

- For every node n,  $\frac{h(n)=h*(n)}{n}$ . The algo is A\*.
- Lemma proved: any time before  $A^*$  terminates, there is a node m in the OL that has  $f(m) <= f^*(S)$ ,  $S^=$  start node (m is the node on the optimal path all whose ancestors in the optimal path are in the closed list).
- For m,  $g(m)=g^*(m)$  and hence  $f(m)=f^*(S)$  Because A\* guarantees to pick the optimal thing.
- Thus at every step, the node with f=f\* will be picked up, and the journey to the goal will be completely directed and definite, with no "search" at all.
- Note: when  $h=h^*$ , f value of any node on the OL can never be less than  $f^*(S)$ . because always  $g(n) >= g^*(n)$

# Exercise-2

If the *h* value for every node over-estimates the *h\** value of the corresponding node by a constant, then the path found need not be costlier than the optimal path by that constant. Prove this.

#### Ans:

- Under the condition of the problem, h(n) <= h\*(n) + c.
- Now, any time before the algo terminates, there exists on the OL a node m such that  $f(m) <= f^*(S) + c$ .
- The reason is as follows: let m be the node on the optimal path all whose ancestors are in the CL (there has to be such a node).
- Now,  $f(m) = g(m) + h(m) = g^*(m) + h(m) <= g^*(m) + h^*(m) + c = f^*(S) + c$
- When the goal G is picked up for expansion, it must be the case that
- $f(G) <= f^*(S) + c = f^*(G) + c$
- *i.e.*,  $g(G) <= g^*(G) + c$ , since  $h(G) = h^*(G) = 0$ .

# Better Heuristic Performs Better

### **Theorem**

A version  $A_2^*$  of  $A^*$  that has a "better" heuristic than another version  $A_1^*$  of  $A^*$  performs at least "as well as"  $A_1^*$ 

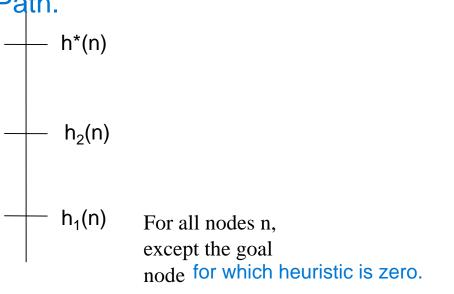

### Meaning of "better"

 $h_2(n) > h_1(n)$  for all n Value of other heuristic is more than the first heuristic for same node wrt all the nodes.

Which is nearer to the actual cost performs more well.

### Meaning of "as well as"

 $A_1^*$  expands at least all the nodes of  $A_2^*$  Or A1\* can explore more than A2\* But both will terminate with Optimal Path.

<u>Proof</u> by induction on the search tree of A<sub>2</sub>\*.

 $A^*$  on termination carves out a tree out of G

### **Induction**

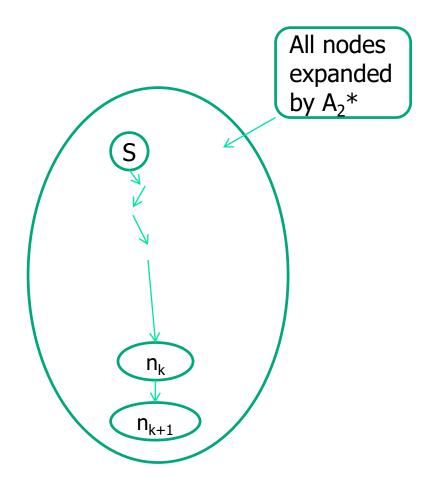

on the depth k of the search tree of  $A_2^*$ .  $A_1^*$  before termination expands all the nodes of depth k in the search tree of  $A_2^*$ .

k=0. True since start node S is expanded by both

Suppose  $A_1^*$  terminates without expanding a node n at depth (k+1) of  $A_2^*$  search tree.

Since  $A_1^*$  has seen all the parents of n seen by  $A_2^*$  as well as seen  $g_1(n) <= g_2(n)$  (1) more nodes as well.

# Proof for $g_1(n_{k+1}) \le g_2(n_{k+1})$ (1/3)

# Proof for $g_1(n_{k+1}) \le g_2(n_{k+1})$ (2/3)

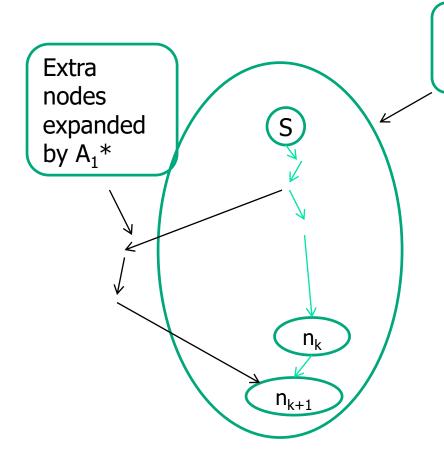

**Case 1:**  $n_k$  is the parent of  $n_{k+1}$  even in  $A_1^*$ 

$$\mathbf{g_1(n_{k+1})} = \mathbf{g_1(n_k)} + \cos t (\mathbf{n_k, n_{k+1}})$$
  
 $<= \mathbf{g_2(n_k)} + \cot (\mathbf{n_k, n_{k+1}})$  .....(1)  
 $<= \mathbf{g_2(n_{k+1})}$ 

(1) ->  $g_1(n_k)$  has to be less than  $g_2(n_k)$  as all nodes expanded by  $A_2^*$  have been expanded by  $A_1^*$  too. Therefore, it can only find a path better than  $A_1^*$  to  $n_k$ .

# Proof for $g_1(n_{k+1}) \le g_2(n_{k+1})$ (3/3)

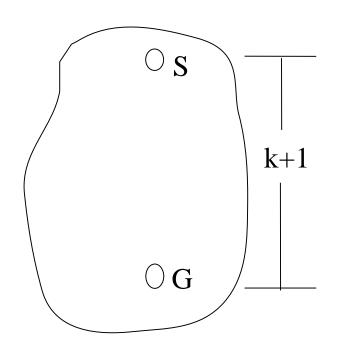

**Case 2:**  $n_k$  is not the parent of  $n_{k+1}$  in  $A_1^*$ 

All nodes expanded by A<sub>2</sub>\*

Since  $A_1^*$  has already expanded all nodes expanded by  $A_2^*$ , if it finds an alternative path through some node(s) other than the ones expanded by  $A_2^*$ , then it has to be better than the path as per  $A_2^*$ . Thus,

$$g_1(n_{k+1}) \le g_2(n_{k+1})$$

Since  $A_1^*$  has terminated without expanding n,

$$f_l(n) >= f^*(S) \quad (2)$$

Any node whose f value is strictly less than  $f^*(S)$  has to be expanded. Since  $A_2^*$  has expanded n

$$f_2(n) <= f^*(S) \tag{3}$$

From (1), (2), and (3)

 $h_I(n) >= h_2(n)$  which is a contradiction. Therefore,  $A_1^*$  has to expand all nodes that  $A_2^*$  has expanded.

#### Exercise

Doubt in this result?

If better means  $h_2(n) > h_1(n)$  for some n and  $h_2(n) = h_1(n)$  for others, then Can you prove the result ?
